

Hi ChatGPT, I want to create an image matching the original (first) image.

Here is my current prompt:

“A **high-quality 3D model** of a young African American chef with an oversized chef hat...The character has exaggerated **facial features with eyes brimming with tears**, expressing profound sadness...”

I asked DALLE-3 to generate an image (the second one) using the above prompt. Does it correctly reflect the original image? If not, please help me modify the prompt.

User Query

Generated Image

Prompt

Black-box
VLM

The generated image has visible differences from the original image. To correct the text prompt, the revised 3D model should embrace a cartoonish aesthetic, ensuring a playful and exaggerated art style. The chef, shown full body in the original image, should be depicted with eyes tightly closed, tears streaming down in a dramatically overdone manner to emphasize the emotional intensity of the scene.

Here is the updated prompt:

“A **cartoon 3D model** of a young African American chef, **shown in full body**, with an oversized chef hat...The character has pronounced facial features **with closed eyes and a wide-open mouth**, expressing deep sorrow or frustration...”
